PDF Output for Printing A4-Sized Reports

Color PDF Output

When performing on-site measurements, you can print out the data and hand-write memos on the paper. Since the SL1400 simultaneously stores data to internal memory while printing, you can keep electronic and hard copy records with just a single action. (Remember that with thermal-sensible paper, it is vital to make photocopies for long-term preservation.)
The SL1400 allows you to export results to files in PDF format, making it easy to save data for long periods of time, transfer the data to distant locations, or load them onto a PC. It is also easy to create reports since waveform data can be converted to an A4-size layout.

Real-Time Hard Drive Recording (with the /C8 Option)

With the optional internal hard drive, you can record measurements to the hard drive in real time. This makes it easy to manage and analyze data using a PC.
Maximum data capacity:
1 GW
Maximum sampling rate:
100 kS/s
(using 1 channel only)

Memory Backup Function

This function backs up about 150 hours of data saved to the acquisition memory immediately prior to power loss. Memory backup helps you avoid losing important data even if the power supply is unstable and gets cut off. (Backup time varies according to the usage environment. Four AA batteries are required for memory backup.)

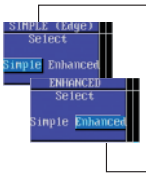
A Wide Range of Trigger Functions for Accurately Capturing a Variety of Waveforms

Having a wide range of triggers is of course very useful for obtaining the desired waveforms. In addition, the GUI menu makes setting trigger conditions easy and intuitive.

Simple and Enhanced Triggers



Edge trigger:	Set a regular edge trigger
A → B (N):	Triggers the n-th time that condition B goes true after condition A has gone true.
A Delay B:	Triggers if condition B goes true after condition A has gone true and an interval at least equal to the delay setting has elapsed.
Edge on A:	Activates an edge trigger on another input during the interval when trigger condition A is true.
OR:	Triggers when any one of the individual channel conditions set with the patterns goes true.
B > TIME:	Triggers when the pulse width is longer than the set time
B < TIME:	Triggers when the pulse width is less than the set time
B TIME OUT:	Triggers when a preset time-out time is reached
Period:	Triggers when a preset waveform frequency condition goes true.
Window:	Triggers when a trigger source enters or leaves a level set by two points
Wave Window:	Triggers when a signal leaves an automatically-defined "wave window" that surrounds the waveform

Action-On Trigger

Automatically Save Measured Data

When this trigger is activated, the SL1400 performs a specified action each time a waveform is captured and displayed on the screen. This feature is useful for saving data automatically and reliably (e.g., for data collection in automated, continuous tests).

Manual Trigger

A Trigger Can Be Activated with the Press of a Button.

With this feature, a trigger can be executed whenever you like, independent from the set trigger conditions.

Wave Window Trigger

Automatically Triggers on Abnormalities in Power Supply Waveforms

This function comes standard with the SL1400 and enable triggering on power supply waveforms. In addition to traditional power supply troubles, such as sudden outages, sags, and surges, you can make efficient real time observations of frequency fluctuations and voltage drops. This trigger activates when a signal exceeds the allowable values determined by comparing a defined waveform (wave window) with an actual waveform in real time. Comparative waveforms can be automatically produced in real time based on measured waveforms. Detection on all 16 analog channels is available (with OR conditions).

Auxiliary measurement functions

Smoothing filter (Moving average)	A moving average is applied to smooth the observed stair-step shaped waveform. The moving average orders are based on a specified time (moving average order = set time ÷ 40 µs). Filters are set at 0.1 ms to 1000 ms for reducing jitter and increasing resolution.
Pulse average function	A mode in which a specified number of pulses are measured together and averaged, with a specifiable number of pulses from 1 to 4096. It has the same effect as the smoothing filter, but averaging is performed at the pulse interval. Even if the encoder interval is uneven, pulses can be measured together and averaged out.
Deceleration prediction	Automatically compensates for lack of information on encoder pulses occurring during deceleration (application of the brake) and calculates a deceleration curve.
Stop prediction (braking application)	A stop is inferred if no pulses are input for a period of time, and output is set to 0. Up to 10 steps can be specified.
Offset observation function	You can set the observational center and zoom the surrounding fluctuations (supports fluctuation observation). Offset setting range = (range 3 100)

■ Power generation electromagnetic pickup: Given output within 0.2 Vpp to 42 Vpp. Minimum sensitivity is 0.2 V (at 1:1) or more, connected with 1:1 cable. For types that require a power supply or terminal resistance, apply to the sensor side.

■ Minimum input must be 0.2 Vpp or more. Measurement conditions:
- During frequency/period measurement: 1 Vpp/1 µs square wave input (range = ±10 V, bandwidth = FULL, and hysteresis = ± 1%)
- During DUTY/pulse width measurement: 1 Vpp/5 ns square wave input (range = ±10 V, bandwidth = FULL, and hysteresis = ± 1%)
- During power supply frequency measurement: 90 Vrms sinewave input (range = AC1000V, BW = 100 kHz)
